Improve % on-time shipment performance in HDPE Manufacturing

Kiran Basme

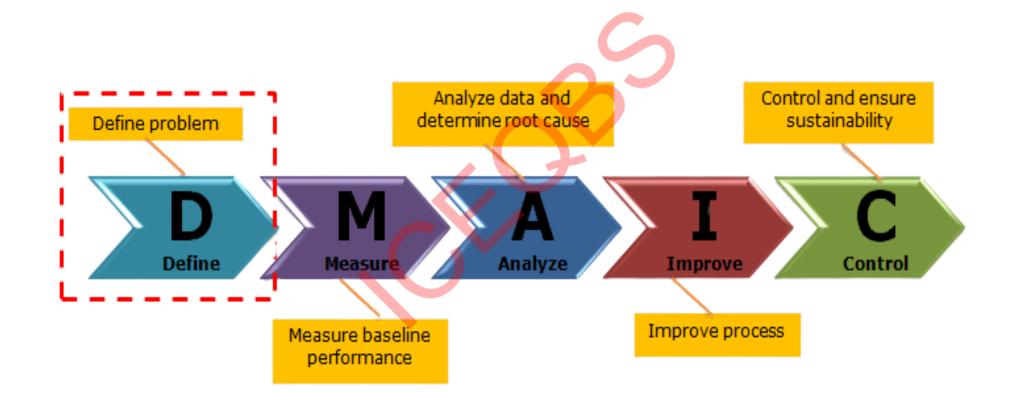

Background

This project, implemented in the manufacturing and supply chain, focuses on improving the on-time shipment performance from the current 89% to a target of 95% within six months.

Timely shipment is vital for sustaining customer trust, satisfaction, and repeat business, as delivery reliability directly influences market competitiveness. Enhancing shipment performance will not only reduce re-shipment and expedited logistics costs but also improve production planning, packaging accuracy, and logistics coordination. Achieving this goal is expected to result in higher customer retention, operational efficiency, and brand credibility in a competitive marketplace.

DEFINE PHASE

VOC & CTQ

CTQ Tree:

| Voice of customer | Critical to X | Primary Metric for improvement |
|---|----------------|--|
| "We need ordered Material on requested time and with requested quality with consistency in quality requirements." | CTD — Delivery | Primary Metric - Y = % OTS (On Time Shipment) Secondary Metric - % E&O |

Baseline Performance of Primary Metric (9 months data as Line chart)

Inference:

• Last 9 months data shows a significant variation and hence ideal problem to be taken up as a Six Sigma Project.

Pareto chart

Inference: The project is going to focus only on **Manual Data Monitoring and Improper Safety Stock Calculation Processes.**

Project Charter

| Project Title: | Improvement of On-Time Shipment to 95% Average |
|--|---|
| Project Leader | Project Team Members: |
| Kiran Basme | Ravi S Nandish K Basu V Arun P |
| Champion/Sponsors: | Key Stake Holders |
| Satish K, VP, Operations | Raw material Planning Team Production Team Management Committee. Quality Team |
| Problem Statement: | Goal Statement: |
| Currently, the average on-time shipment performance states 89%. This shortfall from the expected benchmark has result customer dissatisfaction, increased complaints, and potent repeat business. Root causes have not been fully identified indicators point toward delays in production scheduling, paterrors, and logistics inefficiencies. | of 89% to a minimum of 95% within the next 6 months by identifying and eliminating the key causes of delays across the order fulfilment process. |

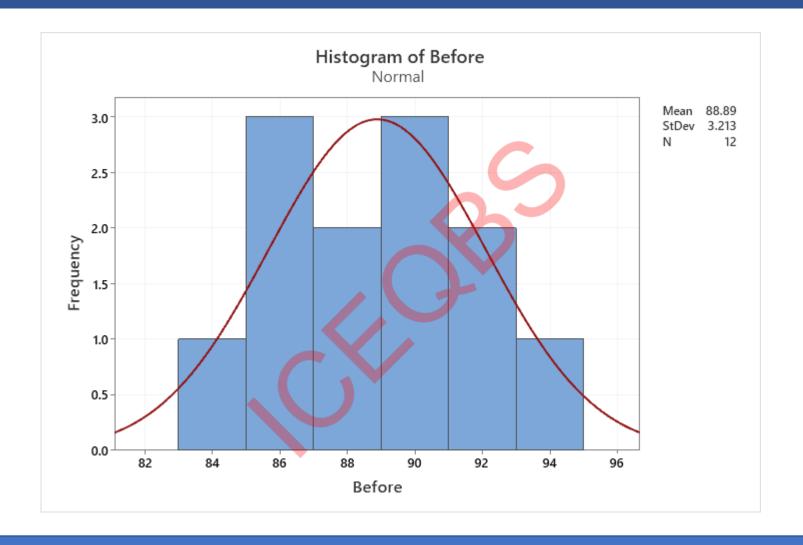

Project Charter

| Tangible and Intangible | |
|--|-------------------------------------|
| Benefits: | Risk to Success: |
| Reduction in logistics and re-shipment costs due to | Inconsistent data tracking |
| fewer delays. | Unforeseen supply chain disruptions |
| Improved on-time delivery rate from 89% to 95%, | Resistance to process change |
| enhancing process efficiency. | |
| Lower inventory holding costs through better | |
| production and dispatch alignment. | |

MEASURE PHASE

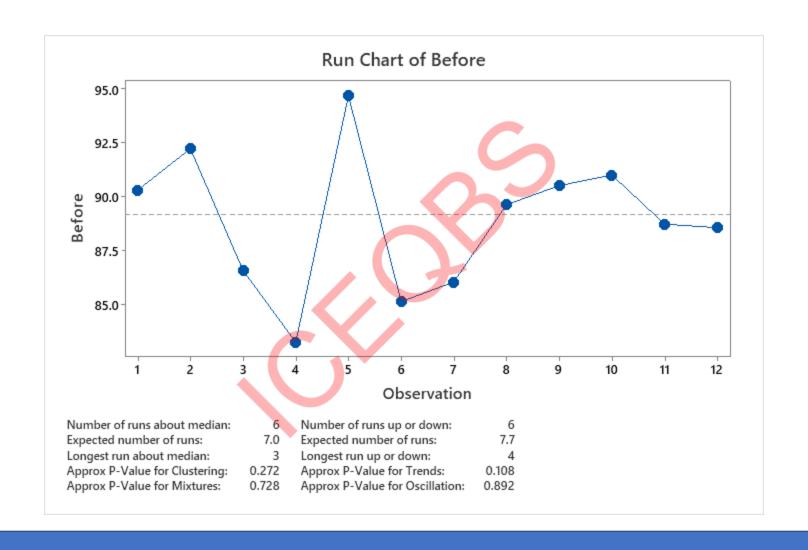

Data collection – Histogram (Before improvement)

Inference:

• Data is normally distributed over the mean

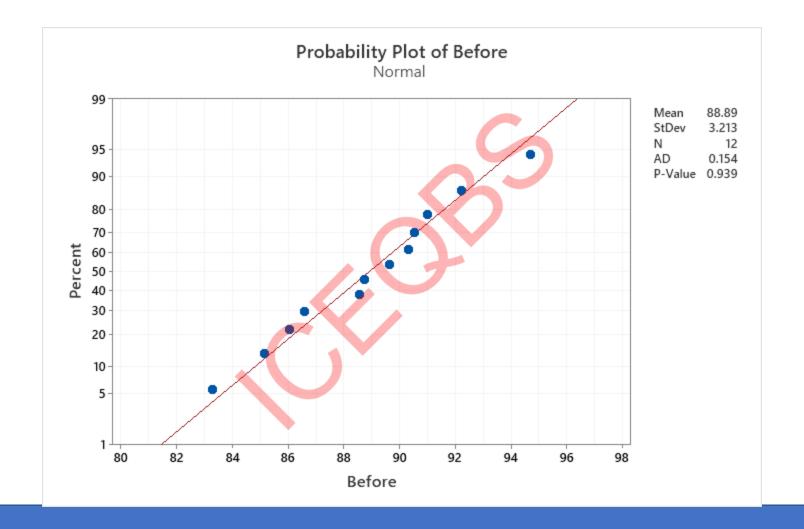

Data collection – Run Chart (Before improvement)

Inference:

P > 0.05 - No special causes in the process. Data can be used for further analysis

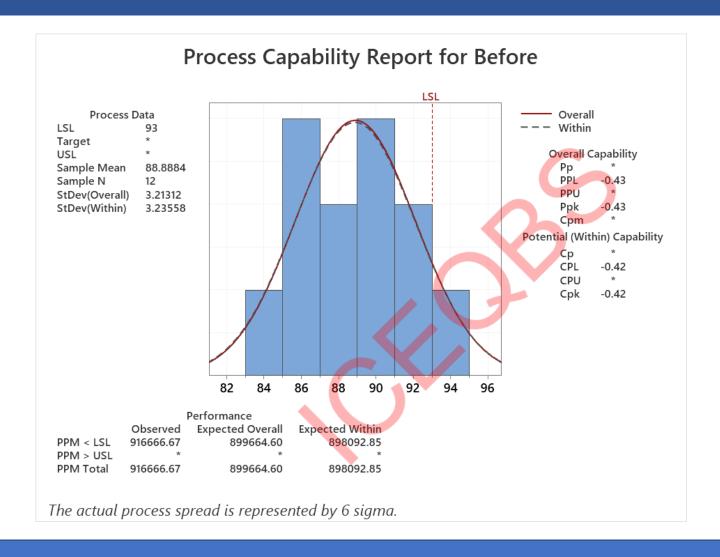

Data collection – Normality plot (Before improvement)

Inference:

• P > 0.05 in all scenarios, thus all the data is normally distributed

Process Capability (Before improvement)

Inference:

Process is highly not capable

Fish Bone Diagram

- Extreme weather affecting inbound or outbound logistics
- Natural disasters disrupting supplier operations
- · Warehouse temperature/humidity affecting product quality
- · Poor lighting or working conditions slowing down picking
- · Power outages affecting system availability.

- Inefficient inventory picking processes
- Lack of standardized procedures for inventory control
- · Inaccurate or outdated demand forecasting methods
- Delays in inventory replenishment cycles
- Complex approval processes for stock release

- Inadequate training in inventory management
- Poor communication between warehouse and logistics staff
- Human error in inventory counting or data entry
- · Lack of accountability for inventory accuracy
- Insufficient staffing during peak periods

METHOD MACHINE MATERIAL

- Inaccurate inventory records
- · Lack of real-time inventory tracking
- No KPIs for on-time shipment performance
- Delay in updating inventory data after stock movement
- Poor analysis of inventory turnover rates

- Outdated inventory management systems
- Barcode scanners malfunctioning
- Poor integration between inventory and shipment systems
- Slow or unresponsive software
- Frequent system downtimes

- Stockouts due to inaccurate demand planning
- Overstocking of low-demand items
- Poor quality or damaged goods affecting availability
- Incorrect labelling of inventory
- Delayed deliveries from suppliers

3M Analysis for Waste

MUDA

- Holding excess stock leads to high carrying costs and risk of obsolescence.
- Unnecessary movement of inventory
- Frequently relocating items due to Space constrain.
- Products sitting unused until they expire or become unsellable represent pure waste.

Mura

- Sharp peaks and troughs in customer orders cause uneven inventory replenishment and staffing issues.
- Some suppliers deliver early, others late, disrupting inventory flow and planning.
- Poor forecasting accuracy leads to overstock in some periods and stockouts in others.

Muri

- Relying on humans to input stock changes causes fatigue and errors, especially during busy periods.
- Forcing staff to work in cramped areas increases physical strain and slows picking efficiency.
- Purchase team will be under stress due to priority issues/Urgency of orders and OTS pressure.

8 Wastes Analysis

Defects

Incorrect stock counts leading to sudden shortage scenarios.

Mislabeling products resulting in delays and manual correction

Overproduction

Ordering bulk inventory without demand to "get a better price"

Producing promotional stock not aligned with actual sales forecasts

Waiting

Staff walking long distances to retrieve items due to poor layout and Poor system knowledge Repeated manual data entry across systems instead of using integrated tools

Non-Utilized Talent

Not involving concerned staff in process improvement or layout design Assigning highly skilled employees to routine manual stock checking

Transportation

Moving inventory between multiple storage locations without value-adding purpose Shipping products to incorrect warehouses and reshipping to correct ones

Inventory

Overstocking slow-moving items leading to space and capital waste Holding safety stock well beyond required levels due to fear of stockouts

Motion

Technicians walking long distances to fetch tools or parts Excessive movement during inspection due to poor layout

Overprocessing

Rechecking inventory multiple times due to lack of trust in system accuracy Printing and filing physical inventory reports that are already stored digitally

Action Plan for Low Hanging Fruits

Special Causes (sudden failures / abnormalities)

| Issue Category | Observed Problem (Gemba) | Lean Tool | Lean Tool Action Item | | Timeline | Expected Benefit |
|-------------------|-------------------------------------|--------------------------------------|--|-------------------|----------|---|
| Special Cause | Supplier Machine Breakdown | VSM | Consider Additional Processing time in Total LT | Purchase | 1 week | Prevent shipment delays due to system failure |
| Special Cause | Delays from customs clearance | Visual Management | Set up visual flags for international orders needing documentation | purchase | 1 week | Reduce lastminute customs- related shipment delays |
| Muda | Overstock of low- demand Items | 5S / ABC Analysis | Reclassify SKUs using ABC and Order Accordingly | Store | 2 weeks | Free up space; reduce holding cost |
| Muda | Excess walking to find items | 5S / Layout Optimization/Al | Reorganize shelves based on picking frequency/Kanban | Store | 1 week | Reduce motion waste, improve picking speed |
| Mura | Fluctuating inventory arrival times | Heijunka (Level Loading) | Schedule supplier deliveries on fixed days | Purchase | 2 weeks | Reduce inventory bursts and shortages |
| Mura | Peaks in warehouse workload | Standard Work / Cross-training | Cross-train staff to shift roles during high-volume days | HR & Ops | 3 weeks | Balance workload, avoid late shipments |
| Muri | Manual counting during peak periods | Cycle Counting / Digital Tools | Implement rolling cycle counts using handheld scanners | Inventory Team | 2 weeks | Reduce stress and improve inventory accuracy |
| Muri | Dependency on one experienced staff | Standard Operating Procedures (SOPs) | Document & train staff on key inventory processes | Training | 2 weeks | Minimize risk, spread workload |

Action Plan for Low Hanging Fruits

Special Causes (sudden failures / abnormalities)

| Issue Category | Observed Problem (Gemba) | Lean Tool | Action Item | Owner | Timeline | Expected Benefit |
|--------------------------|---------------------------------|---|---|-----------|----------|---|
| Waste: Waiting | Waiting for inventory updates | Kanban System | Use Kanban cards/signals for real-time inventory tracking | Store | 1 week | Improve stock visibility and reduce idle time |
| Waste: Defects | Mislabelled inventory | Visual Controls / Barcode Validation | Implement barcode verification during put-away | Store | 1 week | Reduce shipment errors and returns |
| Waste: Transportation | Double handling of inventory | Value Stream Mapping (VSM) | Map current flow and eliminate unnecessary transfers | Lean Peer | 2 weeks | Improve flow, reduce non- value-added handling |
| Waste: Overprocessing | Double checking orders manually | Standard Work + Automation | Automate order verification within WMS | IT / Ops | 2 weeks | Save time and reduce errors |

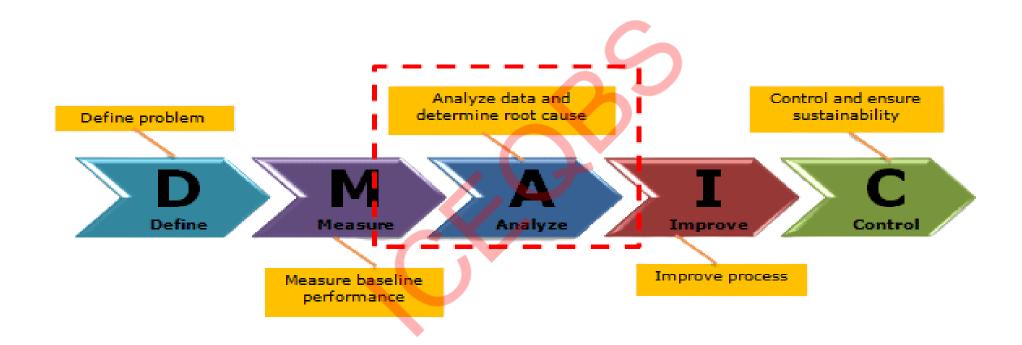

Top 12 Prioritized Root Causes (Based on Net Score)

| Rank | Root Cause Description | Net Score |
|------|-----------------------------------|-----------|
| 1 | Inaccurate stock counts | 268 |
| 2 | No real-time inventory visibility | 253 |
| 3 | Delays in supplier deliveries | 241 |
| 4 | Stockouts of high-demand items | 241 |
| 5 | Ineffective demand forecasting | 238 |
| 6 | Mislabelling of inventory | 238 |
| 7 | Manual inventory updates | 234 |
| 8 | Long replenishment lead time | 225 |
| 9 | System downtime | 216 |
| 10 | No barcode scanning system | 213 |
| 11 | Poor warehouse layout | 206 |
| 12 | Lack of cycle counting | 199 |

Data Collection Plan

| Data Category | Specific Data Points | Source | Frequency | Responsible | Collection Method | Validation |
|------------------------|--|---|--------------|---|--|---|
| Inventory Accuracy | Physical count vs system variance (%) Cycle count errors | Cycle count logs, physical audits | Weekly | Warehouse staff, Inventory control team | Barcode scanning, manual count | Weekly physical audits vs system data |
| Stock Availability | Stockouts by SKU Overstocked SKUs Safety stock levels | Warehouse Management System (WMS) | Daily | Inventory control | ERP/WMS reports, system dashboard | Monthly reconciliation |
| Order Fulfilment | Pick errors Late shipments due to inventory Fill rate (%) | Order processing system / ERP | Daily | Fulfilment team, QA | Order system reports, manual checks | Weekly error report reviews |
| Supplier Performance | On-time delivery rate Lead time variability Quantity accuracy | Procurement records, GRNs | Per shipment | Procurement, Inbound logistics | Purchase order and delivery tracking | Reconcile PO vs GRN per shipment |
| Process Efficiency | Data Monitoring Method purchase Process Inventory update Process | Observations, system logs | Weekly | Lean team, Warehouse supervisor | Time-motion studies, system logs | Supervisor verification |
| Technology Reliability | System downtime frequency/duration Barcode scan success rate | IT system logs | As occurred | IT Department | Automated monitoring tools | Monthly IT review |
| Labor Utilization | Tasks per labour hour Time on non-value activities (searching, rework) | Time tracking systems, observation | Weekly | Operations supervisor, HR | Time tracking software, observation | Cross-check with shift reports |
| Space Utilization | Storage capacity vs usage Inventory density (SKUs per shelf/bin) | Warehouse records, Gemba walks | Monthly | Warehouse manager, Lean team | Physical measurement, Gemba observations | Monthly space audit |

ANALYSE PHASE

Analyse – Hypothesis testing

Regression Equation

OnTime_Delivery = 96.439 - 4.342 Supplier_Delivery_Delay - 1.5154 Stockouts

| Coefficients | | | | | |
|-------------------------|---------|---------|---------|---------|------|
| Term | Coef | SE Coef | T-Value | P-Value | VIF |
| Constant | 96.439 | 0.873 | 110.46 | 0.000 | |
| Supplier_Delivery_Delay | -4.342 | 0.196 | -22.10 | 0.000 | 1.02 |
| Stockouts | -1.5154 | 0.0374 | -40.50 | 0.000 | 1.02 |

Model Summary

| S | R-sq | R-sq(adj) | R-sq(pred) |
|---------|--------|-----------|------------|
| 1.75873 | 95.19% | 95.09% | 94.85% |

Analysis of Variance

| Source | DF | Adj SS | Adj MS | F-Value | P-Value |
|-------------------------|----|--------|---------|---------|---------|
| Regression | 2 | 5939.4 | 2969.69 | 960.10 | 0.000 |
| Supplier_Delivery_Delay | 1 | 1511.1 | 1511.07 | 488.53 | 0.000 |
| Stockouts | 1 | 5073.2 | 5073.22 | 1640.16 | 0.000 |
| Error | 97 | 300.0 | 3.09 | | |
| Total | 99 | 6239.4 | | | |

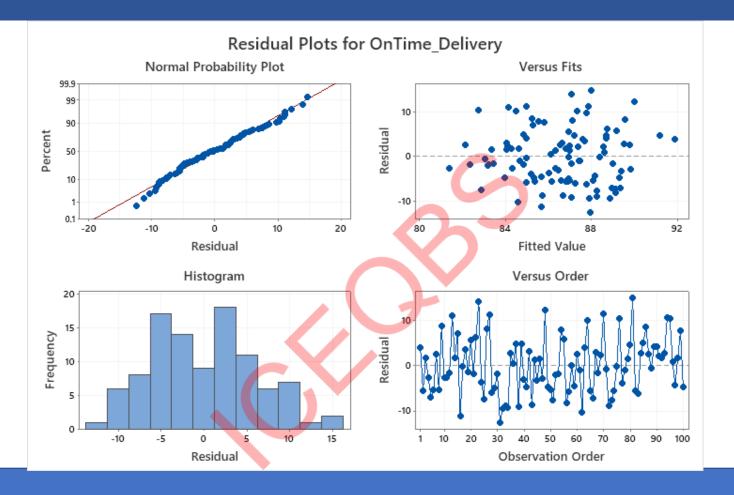

Conditions to meet and analyse:

- 1) All VIFs are less than 5 (if any VIF is more for any root cause then both are inter connected directly/indirectly). So now here all X's are <5 so no one is inter connected.
- 2)R-sq-Adj- 85> . Now here its 95.09 . Model is ok . Increased from previous model
- 3) Regression p value 5< . Its meeting requirement.
- 4) individual p values should be 5<. now all of p values are more less 0.05 so all considered X's are critical and impacting output -OTS.

Inference:

Since p < 0.05, thus not all means are equal

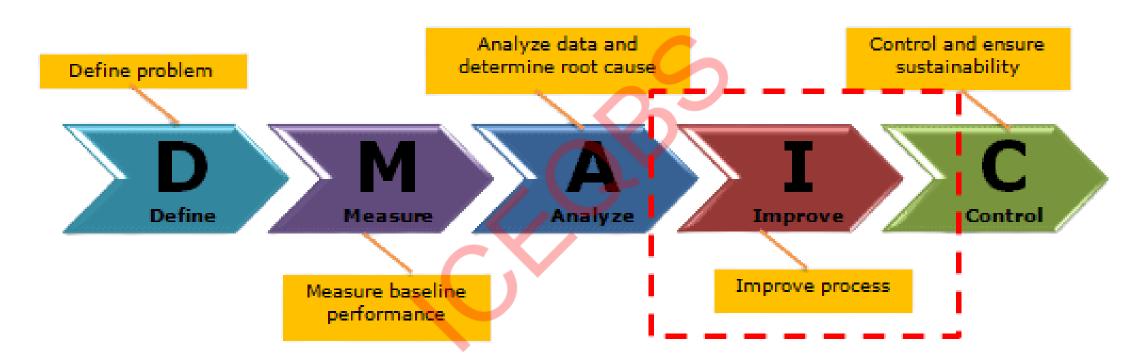

Analyse – Hypothesis testing

Inference:

Both plots confirm that the residuals are normal, independent, and random — meaning the model
fits the data well, and the underlying assumptions for regression or process analysis are satisfied.

IMPROVE PHASE

Improve

Root Cause 2: Inventory Stockouts or Inaccurate Inventory Data Impact: Orders cannot be fulfilled on time due to unavailability of stock or mismatched data.

| Action | Responsibility | Timeline | Key Metrics |
|---|----------------------|------------|------------------------------|
| Conduct cycle counts and reconcile inventory data | Warehouse Manager | Weekly | Inventory accuracy (%) |
| Implement real-time inventory management system | IT + Inventory Team | 2–3 months | System uptime; accuracy rate |
| Improve demand forecasting to match stock levels | Demand Planning Team | Monthly | Forecast vs. actual variance |

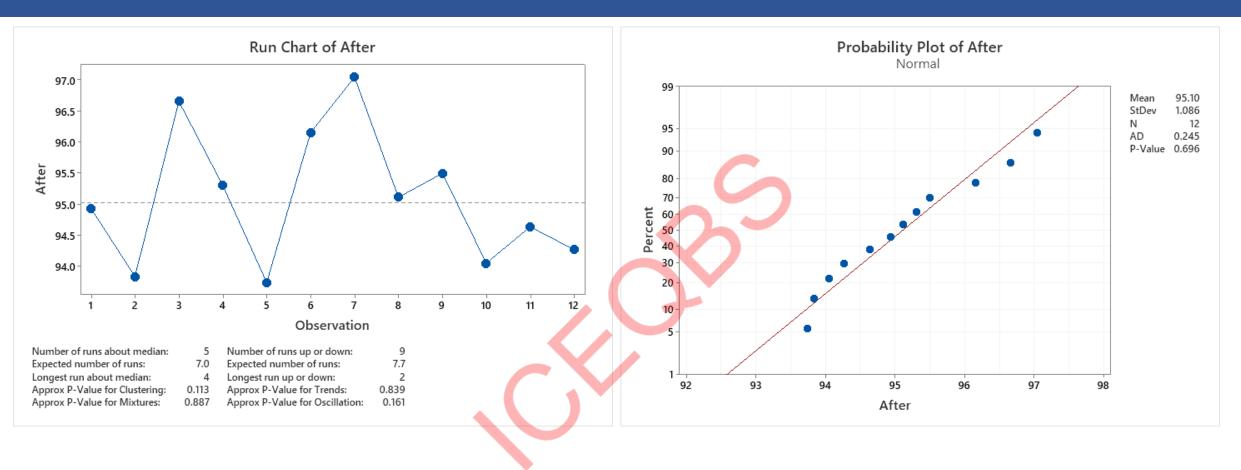

Improve

Root Cause 7: Poor Supplier Evaluation and Market Analysis

Impact: Low supplier performance, lack of competition, poor value for money.

| Action | Responsibility | Timeline | Key Metrics | |
|---|------------------------------|-------------|------------------------------|--|
| Develop and use standardized supplier evaluation criteria | Procurement Quality Lead | 1 month | Evaluation form in use | |
| Conduct regular market assessments for key categories | Procurement + Market Analyst | Bi-annually | No. of assessments conducted | |
| Create and update a supplier performance database | Procurement IT Team | 2 months | Database update frequency | |

Improve – Run chart and Normality Test (After Improvement)

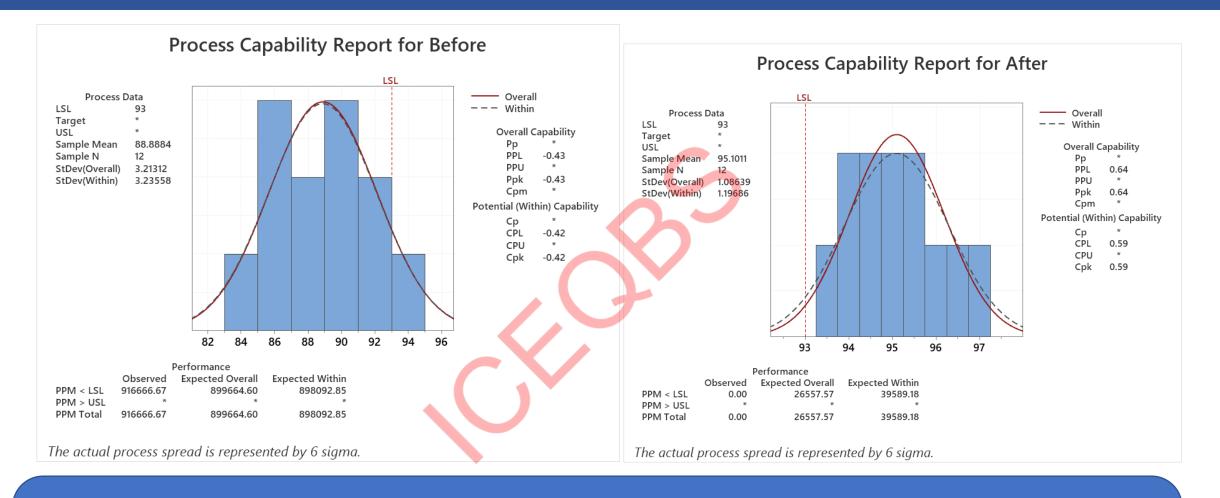

Inference:

• Run chart – process is stable there is no special causes in the process (p value > 0.05)

Inference:

Normality test – Data are normally distributed

Improve – Process capability – Before & After Improvement

Inference:

- Before Cpk < After Cpk, which shows process is much more capable after improvement
- There is less variability in system since stdev reduced after improvement
- After improvement the data are normally distributed near the target within specified limit

Improve –After Improvement (Statistical validation for Improvement – Hypothesis Testing)

Two-Sample T-Test and CI: Before, After

 μ_1 : population mean of Before μ_2 : population mean of After Difference: $\mu_1 - \mu_2$

Equal variances are not assumed for this analysis.

Descriptive Statistics

| Sample | N | Mean | StDev | SE Mean |
|--------|----|-------|-------|---------|
| Before | 12 | 88.89 | 3.21 | 0.93 |
| After | 12 | 95.10 | 1.09 | 0.31 |

Estimation for Difference

| | 95% CI for |
|------------|------------------|
| Difference | Difference |
| -6.213 | (-8.328, -4.097) |

Test

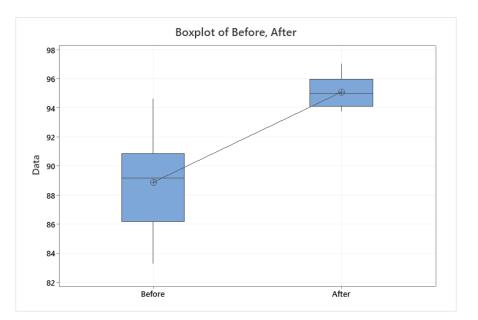

| Null hypothesis | H_0 : $\mu_1 - \mu_2 = 0$ |
|------------------------|--------------------------------|
| Alternative hypothesis | H_1 : $\mu_1 - \mu_2 \neq 0$ |

| T-Value | DF | P-Value |
|---------|----|---------|
| -6.35 | 13 | 0.000 |

Inference:

- Since P value is less than 0.05, there is enough evidence to reject the null hypothesis and we can conclude that the difference between the population means is statistically significant.
- It is also visible from the individual value plot & box plot, there is clear difference in mean after improvement which is closer to required % scrap
